

URODYNAMICS

WHAT IS URODYNAMICS

Urodynamics refers to a series of diagnostic tests that evaluate the function of the bladder and urethra. These tests may be recommended if you have urinary incontinence (leakage of urine), recurrent bladder infections, slow or weak urinary stream, incomplete bladder emptying, urinary urgency or frequent urination.

HOW TO PREPARE FOR URODYNAMIC STUDIES

- Before your appointment, you may be asked to complete a questionnaire or voiding diary. Please bring this with you to the appointment.
- You may also be asked to complete a Fleet Enema the night before your appointment. You can purchase the Fleet Enema over the counter at any drugstore.
- At the beginning of the test, you will be asked to provide a urine sample, so please arrive for the study with a relatively full bladder.
- You may eat or drink before the study without restriction.
- Take your medications as normally scheduled, unless otherwise directed.

The tests typically take about 60 minutes and causes very little pain, so no anesthesia is necessary. A catheter (soft, hollow tube) or special sensor will be carefully placed in your urethra and the rectum for males and either the vagina or rectum for females. Females may also need vaginal packing.

A friend and/or family member is welcome to accompany you to the test but will be asked to remain in the waiting area. You will be able to resume all previous activities, including driving, after the urodynamic studies.

Types of Urodynamic Studies

Your physician will decide which of the following tests needs to be performed to help diagnose and treat your condition.

UROFLOW

This test measures the speed and the amount of urine you void. You should come to the test feeling as though you need to urinate. Try not to empty your bladder one hour before your test. You will be asked to urinate into a commode with a funnel attached to a computer that measures urine flow.

CYSTOMETROGRAM

This study evaluates how your bladder holds urine, measures your bladder capacity, and determines how well you can empty your bladder. Your bladder will be filled with fluid through a catheter. To reproduce your bladder symptoms, you should report any sensations you feel during the study. In addition, you may be asked to cough, bear down, stand, or walk in place during the test. At the end of the study, you will be asked to urinate.

EMG

This test measures how well you can control your sphincter muscles (the muscles that keep urine in the bladder) and determines if they are working in coordination with your bladder. Electrodes may be placed near the rectum to record muscle activity.

Colorado

PRESSURE FLOW STUDY

This test determines if there is an obstruction. After your bladder is filled through a catheter, you will be asked to urinate as you normally would by sitting on a commode or standing. The study simultaneously records bladder pressure and urine flow rate.

VIDEOURODYNAMICS

This study combines one or more urodynamic tests with the addition of video pictures. If this study is prescribed, the doctor will be present to explain each step of the process. Your bladder will be filled with contrast fluid, and X-ray video pictures will be taken to see your bladder in motion during filling and emptying. After the procedure, the doctor will discuss the study results with you. A detailed report will be sent to your physician including a summary of results, diagnosis, and suggestions for treatment. After reviewing the report, your physician will speak with you about the findings and your options for treatment.

What To Expect at Your Appointment

In preparation for your urodynamics study, here's what you can expect:

- 1. Your urodynamics appointment will take approximately 60 minutes. Please arrive 15 minutes before your appointment time to complete any necessary forms.
- 2. Arrive with a comfortably full bladder.
- **3.** A urine sample will be obtained.
- **4.** You will be asked to empty your bladder into a uroflow meter that will automatically measure the amount of urine and flow rate.
- **5.** The urodynamicist will then perform a post-void residual. This involves the placement of a thin tube in your bladder to measure the amount of urine remaining.
- 6. The recommended urodynamic study will then be performed. This study will evaluate: 1) how much your bladder can hold;2) how much pressure builds up inside your bladder as it stores urine; and 3) how full it is when you feel the urge to urinate.
- **7.** Your physician will review the results with you at your next visit.

BLADDER HEALTH QUESTIONNAIRE (FOR MEN)

Name:	Date:
Patient ID#	
Which symptom(s) best describes you?	
☐ Frequent urination – Circle one: Day Night Both	1
\Box Sudden or strong urge to urinate	
Leaking with urge or no warning	
\Box Leaking with sneezing, coughing or exercising	
\Box Difficulty starting to urinate or straining to urinate	
□ Pain with urination	
Unable to empty the bladder	
\square None of these describe me. Please describe your experience	e or what brings you into the office.
How long have you had these symptoms?	
How frequently do you urinate during the daytime?	Times Volume (check one): 🗆 A lot 🛛 Minimal
How many times do you urinate at night (Nocturia)?	Times Volume (check one): 🗌 A lot 🗌 Minimal
Do you currently have any problems with bowel function?	
\Box Difficulty with bowel movements \Box Leaking stool \Box Oth	ner
When did your urinary difficulty begin?	
□ Following a prostate condition or treatment? Please explain	۱۰
Other (Please explain)	
Which symptoms bother you the most?	

What is your level of frustration with your bladder symptoms? Please circle the number that reflects the degree of frustration:

VOIDING DIARY - INSTRUCTIONS

What Is a Bladder Diary?

A bladder diary is a 3-day recording of your liquid intake and urine output. The recorded information can be helpful to your healthcare provider to understand your fluid balance, urinary frequency, functional bladder capacity (how much your bladder holds in your own environment), and many other aspects important to bladder function. This will be used to establish a baseline before treatment and track progress.

When is a Bladder Diary Used?

Your healthcare provider may request that you complete a diary to evaluate urinary frequency, urgency, or incontinence. You may also choose to complete a diary before you see the healthcare provider about a bladder problem. A bladder diary can point to any dietary or behavioral factors that may be contributing to your bladder symptoms.

How to Complete the Diary:

- **1.** Please collect three (3) days of information; with days do not need to be consecutive. A one-day diary may not be representative of your bladder condition, which is why a 3-day diary is recommended.
- **2.** Begin and end the diary at the same time each day. (Example: Begin when you wake up at 6:00 a.m. and end at 6:00 a.m. the following day.)
- **3.** Record the time of urination (Example: 6:00 a.m.) and record the volume of urine output whenever possible.
- **4.** Record the fluid intake to the nearest ounce. A very reasonable estimation (8 oz. cup of juice, 12 oz. coke, or 20 oz. water) is appropriate. You do not need to physically measure every fluid if you know the size of the bottle, can, or cup from which you are drinking.
- 5. Estimate the urine output as small, medium, and large amounts.
- 6. Be as accurate as possible! The diaries are most useful when every intake and output in 24 hours over three (3) days is recorded.

VOIDING DIARY – DAY 1

Patient Name:

Date of Birth: _____ Date: _____

Use diary below to record urinary output, fluids consumed, urinary urgency and urinary leakage (if applicable) for 3 complete 24-hour periods (they do not have to be consecutive days). If you used a catheter to empty or assist in emptying your bladder, record those volumes in the specified column.

Time of Day	Fluid Intake	Toilet Urinations	Urge to Urinate	Urine Leaks	Bowel Leaks	Pad Changes		rine drained theter
